

## Perpetual Water – Home™ Grey Water Purification System

**Most of the water we watch flow down the drain every day is safe to reuse once it is properly treated and purified. Known as grey water, it is the water that comes from the shower, bath, clothes washing machine, hand basin and laundry tub.**

The average family watches about 600 litres of this precious water flow down their drains every day. That's about 220,000 litres of water per year.

Left untreated, grey water contains very high levels of bacteria, soap and other contaminants that can harm your health and damage your garden. Proper treatment is critical if you want to harness the long term benefits of this valuable resource, without compromising your family's health or the environment.

The fully automated Perpetual Water - Home™ Grey Water Purification System collects grey water and treats it to a standard suitable for surface irrigation, toilet flushing, car washing, clothes washing and the filling of ponds and water features.

Establishing and maintaining a beautiful garden takes time and money. With the long term effects of water restrictions and drought, no one wants to see the hard work they put into a garden go to waste.

Having an abundant water supply day in day out is essential to protect your client's investment in their landscaped garden.
